

Steps to install matplotlib in python

1. We need to set python installation directory in path variable. First, identify the installation directory of Python.

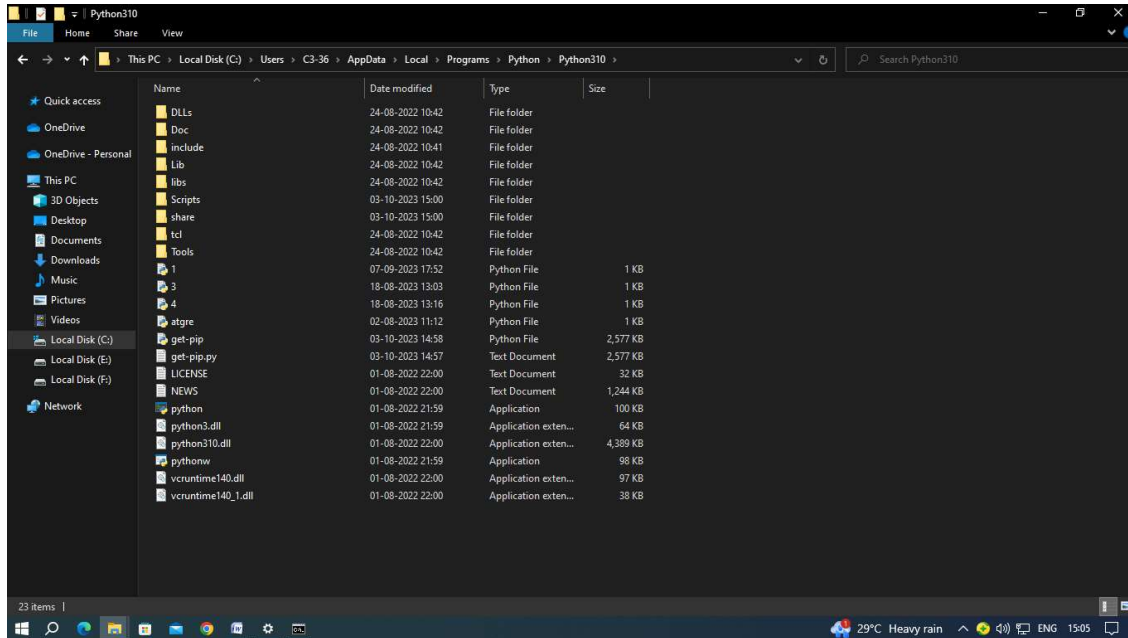

Fig: python installation directory

Your path will resemble: **C:\Users\C3-36\AppData\Local\Programs\Python\Python310**

2. Set the path. Right click the “File Explorer”, click on “Properties”. From the right hand side menu, select “Advanced System Settings”. The “System Properties” dialog box will open up. Here, click on “Environment Variables” option. In the new dialog box, under the “System Variables” option, find the variable called “Path” and double click on it. Next, click the “New” option to add a new directory to path. Here, paste the python installation directory retrieved in Step 1.
3. In this folder from Step 1, paste the file provided to you.
4. Open Command Prompt in this directory and execute the “get-pip.py” file. Now pip will be installed successfully.
5. Within the same folder from Step 1, open up the “Scripts” folder and copy the new path. Paste it as a new “path” variable in “System Variables” similar to Step 2.
6. Open up Command Prompt. Type “pip install matplotlib”. Once installation is complete, you can simple check by typing “import matplotlib” in the python prompt.
